## ABOUT ME

I am a Ph.D. student under the supervision of Prof. Hendrik P. A. Lensch in the Computer Graphics Group at the University of Tübingen. My research interests lie at the intersection of machine learning and computer graphics. The main research question is how to perform inverse rendering on sparse and casual captured images. Here, I primarily focus on enabling efficient material appearance acquisition.

## EDUCATION

### Ph. D. Student

Jun 2018 - Present

University of Tübingen, Germany

Advisor: Prof. Hendrik P. A. Lensch

### Master of Science (M. Sc.)

Feb 2016 - Apr 2018

University of Tübingen, Germany

Advisor: Prof. Hendrik P. A. Lensch

Thesis: CNN-based BRDF parameter estimation

### Bachelor of Science (B. Sc.)

Sep 2012 - Feb 2016

Osnabrück University of Applied Sciences, Germany

## WORK EXPERIENCE

### Research Intern - NVIDIA - Westford, MA

Apr 2019 - Jul 2019

Research on casual shape and material acquisition, which resulted in the publication: "Two-shot Spatially-varying BRDF and Shape Estimation"

### Android Developer - zahlz - Osnabrück, Germany

Jul 2015 - Jun 2017

Development of an Android Application for a mobile payment system using Bluetooth LE.

### Teaching - Ph. D. Student - University of Tübingen, Germany

Jun 2018 - Present

During my employment as a Ph. D. student, I have overseen several Bachelor's and Master's theses. I have also created and hold seminars, practical courses, and tutorials at the university.

## SELECTED PUBLICATIONS

### NeRD: Neural Reflectance Decomposition from Image Collections

Dec 2020 - *arXiv Preprint* - Mark Boss, Raphael Braun, Varun Jampani, Jonathan T. Barron, Ce

A method that decomposes multiple images into shape, reflectance, and illumination by creating a consistent neural volume. Here, even numerous different illuminations between images can be used, which allows for flexible data sources and capture setups.

### Two-shot Spatially-varying BRDF and Shape Estimation

Jun 2020 - *IEEE CVPR* - Mark Boss, Varun Jampani, Kihwan Kim, Hendrik P. A. Lensch, Jan Kautz

A method capable of decomposing two images, one with flash and one without, into shape, reflectance, and illumination. Here, due to a sequential pipeline, the inference is even possible on mobile devices.
